

Package ‘provenance’

March 15, 2016

Title Statistical Toolbox for Sedimentary Provenance Analysis

Version 1.5

Description Bundles a number of established statistical methods to facilitate the visual interpretation of large datasets in sedimentary geology. Includes functionality for adaptive kernel density estimation, multidimensional scaling, generalised procrustes analysis and individual differences scaling using a variety of dissimilarity measures. Univariate provenance proxies, such as single-grain ages or (isotopic) compositions are compared with the Kolmogorov-Smirnov dissimilarity and Sircombe-Hazelton L2-norm. Categorical provenance proxies, such as mineralogical, petrographic or chemical compositions are compared with the Aitchison and Bray-Curtis distances. Also included are tools to plot compositional data on ternary diagrams, to calculate the sample size required for specified levels of statistical precision, and to assess the effects of hydraulic sorting on detrital compositions. Includes an intuitive query-based user interface for users who are not proficient in R.

amalgamate

Group components of a composition

Description

Adds several components of a composition together into a single component

Usage

```

amalgamate(X, ...)

## Default S3 method:
amalgamate(X, ...)

## S3 method for class 'compositional'
amalgamate(X, ...)

## S3 method for class 'SRDcorrected'
amalgamate(X, ...)

```

Arguments

X	a compositional dataset
...	a series of new labels assigned to strings or vectors of strings denoting the components that need amalgamating

Value

an object of the same class as X with fewer components

Examples

```

data(Namib)
HMcomponents <- c("zr", "tm", "rt", "TiOx", "sph", "ap", "ep",
                  "gt", "st", "amp", "cpx", "opx")
am <- amalgamate(Namib$PTHM, feldspars=c("KF", "P"),
                 lithics=c("Lm", "Lv", "Ls"), heavies=HMcomponents)
plot(ternary(am))

```

as.acomp

create an acomp object

Description

Convert an object of class `compositional` to an object of class `acomp` for use in the `compositions` package

Usage

```
as.acomp(x)
```

Arguments

x	an object of class <code>compositional</code>
---	---

Value

a data.frame

Examples

```
data(Namib)
qfl <- ternary(Namib$PT,c('Q'),c('KF','P'),c('Lm','Lv','Ls'))
plot(qfl,type="QFL.dickinson")
qfl.acomp <- as.acomp(qfl)
## uncomment the next two lines to plot an error
## ellipse using the compositions package:
# library(compositions)
# ellipses(mean(qfl.acomp),var(qfl.acomp),r=2)
```

as.compositional	<i>create a compositional object</i>
------------------	--------------------------------------

Description

Convert an object of class matrix, data.frame or acomp to an object of class compositional

Usage

```
as.compositional(x, method = NULL, colmap = "rainbow")
```

Arguments

x	an object of class matrix, data.frame or acomp
method	dissimilarity measure, either 'aitchison' for Aitchison's CLR-distance or 'bray' for the Bray-Curtis distance.
colmap	the colour map to be used in pie charts.

Value

an object of class compositional

Examples

```
data(Namib)
PT.acomp <- as.acomp(Namib$PT)
PT.compositional <- as.compositional(PT.acomp)
print(Namib$PT$x - PT.compositional$x)
## uncomment the following lines for an illustration of using this
## function to integrate the \code{provenance} package with \code{compositions}
# library(compositions)
# data(Glacial)
# a.glac <- acomp(Glacial)
# c.glac <- as.compositional(a.glac)
# summaryplot(c.glac,ncol=8)
```

```
as.data.frame.compositional
      create a data.frame object
```

Description

Convert an object of class `compositional` to a `data.frame` for use in the `robCompositions` package

Usage

```
## S3 method for class 'compositional'
as.data.frame(x, ...)
```

Arguments

`x` an object of class `compositional`
`...` optional arguments to be passed on to the generic function

Value

a `data.frame`

Examples

```
data(Namib)
qfl <- ternary(Namib$PT,c('Q'),c('KF','P'),c('Lm','Lv','Ls'))
plot(qfl,type="QFL.dickinson")
qfl.frame <- as.data.frame(qfl)
## uncomment the next two lines to plot an error
## ellipse using the robCompositions package:
# library(robCompositions)
# pca <- pcaCoDa(qfl.frame)
# plot(pca,xlabs=rownames(qfl.frame))
```

```
botev                      Compute the optimal kernel bandwidth
```

Description

Uses the diffusion algorithm of Zdravko Botev (2011) to calculate the bandwidth for kernel density estimation

Usage

```
botev(x)
```

Arguments

x a vector of ordinal data

Value

a scalar value with the optimal bandwidth

Author(s)

Dzdravko Botev

References

Botev, Z. I., J. F. Grotowski, and D. P. Kroese. "Kernel density estimation via diffusion." *The Annals of Statistics* 38.5 (2010): 2916-2957.

Examples

```
fname <- system.file("DZ.csv", package="provenance")
bw <- botev(read.distributional(fname)$x$N1)
print(bw)
```

bray.diss

Bray-Curtis dissimilarity

Description

Calculates the Bray-Curtis dissimilarity between two samples

Usage

```
bray.diss(x, y)
```

Arguments

x a vector containing the first compositional sample
y a vector of length(x) containing the second compositional sample

Value

a scalar value

Examples

```
data(Namib)
print(bray.diss(Namib$HM$x["N1",], Namib$HM$x["N2",]))
```

CLR	<i>Centred logratio transformation</i>
-----	--

Description

Calculates Aitchison's centered logratio transformation for a dataset of class compositional

Usage

```
CLR(x)
```

Arguments

x an object of class compositional

Value

a matrix of CLR coordinates

Examples

```
# The following code shows that applying provenance's PCA function
# to compositional data is equivalent to applying R's built-in
# princomp function to the CLR transformed data.
data(Namib)
plot(PCA(Namib$Major))
dev.new()
clrdat <- CLR(Namib$Major)$x
biplot(princomp(clrdat))
```

combine	<i>Combine samples of distributional data</i>
---------	---

Description

Lumps all single grain analyses of several samples together under a new name

Usage

```
combine(X, ...)
```

Arguments

X a distributional dataset
... a series of new labels assigned to strings or vectors of strings denoting the samples that need amalgamating

Value

a distributional data object with fewer samples than X

Examples

```
data(Namib)
combined <- combine(Namib$DZ,east=c('N3','N4','N5','N6','N7','N8','N9','N10'),
                    west=c('N1','N2','N11','N12','T8','T13'))
summaryplot(KDEs(combined))
```

densities

A list of rock and mineral densities

Description

List of rock and mineral densities using the following abbreviations: Q (quartz), KF (K-feldspar), P (plagioclase), F (feldspar), Lvf (felsic/porfiritic volcanic rock fragments), Lvm (microlithic / porfiritic / trachitic volcanic rock fragments), Lcc (calcite), Lcd (dolomite), Lp (marl), Lch (chert), Lms (argillaceous / micaceous rock fragments), Lmv (metavolcanics), Lmf (metasediments), Lmb (metabasites), Lv (volcanic rock fragments), Lc (carbonates), Ls (sedimentary rock fragments), Lm (metamorphic rock fragments), Lu (serpentine), mica, opaques, FeOx (Fe-oxides), turbids, zr (zircon), tm (tourmaline), rt (rutile), TiOx (Ti-oxides), sph (titanite), ap (apatite), mon (monazite), oth (other minerals), ep (epidote), othLgM (prehnite + pumpellyite + lawsonite + carpholite), gt (garnet), ctd (chloritoid), st (staurolite), and (andalusite), ky (kyanite), sil (sillimanite), amp (amphibole), px (pyroxene), cpx (clinopyroxene), opx (orthopyroxene), ol (olivine), spinel and othHM (other heavy minerals).

distribution <- minsorting(N8,densities,phi=2,sigmaphi=1,medium="air",by=0.05)
plot(distribution)
```

diss	<i>Calculate the dissimilarity matrix between two distributional or compositional datasets</i>
------	--

Description

Calculate the dissimilarity matrix between two datasets of class distributional or compositional using the Kolmogorov-Smirnov, Sircombe-Hazelton, Aitchison or Bray Curtis distance

Usage

```
diss(x, method)

## S3 method for class 'distributional'
diss(x, method = NULL)

## S3 method for class 'compositional'
diss(x, method = NULL)
```

Arguments

x	an object of class distributional or compositional
method	(optional) either "KS", "SH", "aitchison" or "bray"

Value

an object of class diss

Examples

```
data(Namib)
print(round(100*diss(Namib$DZ)))
```

endmembers	<i>Petrographic end-member compositions</i>
------------	---

Description

A compositional dataset comprising the mineralogical compositions of the following end-members: undissected_magmatic_arc, dissected_magmatic_arc, ophiolite, recycled_clastic, undissected_continental_block, transitional_continental_block, dissected_continental_block, subcreted_axial_belt and subducted_axial_belt

get.f

Calculate the largest fraction that is likely to be missed

Description

For a given sample size, returns the largest fraction which has been sampled with $p \times 100$

Usage

```
get.f(n, p = 0.05)
```

Arguments

n	the number of grains in the detrital sample
p	the required level of confidence

Value

the largest fraction that is sampled with at least $100 \times p$ certainty

References

Vermeesch, Pieter. "How many grains are needed for a provenance study?." Earth and Planetary Science Letters 224.3 (2004): 441-451.

Examples

```
print(get.f(60))
print(get.f(117))
```

get.n	<i>Calculate the number of grains required to achieve a desired level of sampling resolution</i>
-------	--

Description

Returns the number of grains that need to be analysed to decrease the likelihood of missing any fraction greater than a given size below a given level.

Usage

```
get.n(p = 0.05, f = 0.05)
```

Arguments

p	the probability that all n grains in the sample have missed at least one fraction of size f
f	the size of the smallest resolvable fraction ($0 < f < 1$)
n,	the number of grains in the sample

Value

the number of grains needed to reduce the chance of missing at least one fraction f of the total population to less than p

References

Vermeesch, Pieter. "How many grains are needed for a provenance study?." Earth and Planetary Science Letters 224.3 (2004): 441-451.

Examples

```
# number of grains required to be 99% that no fraction greater than 5% was missed:  
print(get.n(0.01))  
# number of grains required to be 90% that no fraction greater than 10% was missed:  
print(get.n(p=0.1,f=0.1))
```

<code>get.p</code>	<i>Calculate the probability of missing a given population fraction</i>
--------------------	---

Description

For a given sample size, returns the likelihood of missing any fraction greater than a given size

Usage

```
get.p(n, f = 0.05)
```

Arguments

<code>n</code>	the number of grains in the detrital sample
<code>f</code>	the size of the smallest resolvable fraction ($0 < f < 1$)

Value

the probability that all `n` grains in the sample have missed at least one fraction of size `f`

References

Vermeesch, Pieter. "How many grains are needed for a provenance study?." *Earth and Planetary Science Letters* 224.3 (2004): 441-451.

Examples

```
print(get.p(60))
print(get.p(117))
```

GPA	<i>Generalised Procrustes Analysis of configurations</i>
-----	--

Description

Given a number of (2D) configurations, this function uses a combination of transformations (reflections, rotations, translations and scaling) to find a 'consensus' configuration which best matches all the component configurations in a least-squares sense.

Usage

```
GPA(X, scale = TRUE)
```

Arguments

<code>X</code>	a list of dissimilarity matrices
<code>scale</code>	boolean flag indicating if the transformation should include the scaling operation

Value

a two column vector with the coordinates of the group configuration

See Also

procrustes

indscal

Individual Differences Scaling of provenance data

Description

Performs 3-way Multidimensional Scaling analysis using Carroll and Chang (1970)'s INdividual Differences SCALing method as implemented using De Leeuw and Mair (2011)'s stress majorization algorithm.

Usage

```
indscal(..., type = "ordinal")
```

Arguments

... a sequence of datasets of class `distributional` or `compositional`
type is either "ratio" or "ordinal"

Value

an object of class `INDSCAL`, i.e. a list containing the following items:

delta: Observed dissimilarities

obsdiss: List of observed dissimilarities, normalized

confdiss: List of configuration dissimilarities

conf: List of matrices of final configurations

gspace: Joint configurations aka group stimulus space

cweights: Configuration weights

stress: Stress-1 value

spp: Stress per point

sps: Stress per subject (matrix)

ndim: Number of dimensions

model: Type of smacof model

niter: Number of iterations

nobj: Number of objects

Author(s)

Jan de Leeuw and Patrick Mair

References

de Leeuw, J., & Mair, P. (2009). Multidimensional scaling using majorization: The R package smacof. *Journal of Statistical Software*, 31(3), 1-30, < <http://www.jstatsoft.org/v31/i03/>>

Examples

```
data(Namib)
plot(indscal(Namib$DZ,Namib$HM))
```

KDE

Create a kernel density estimate

Description

Turns a vector of numbers into an object of class KDE using a combination of the Botev (2010) bandwidth selector and the Abramson (1982) adaptive kernel bandwidth modifier.

Usage

```
KDE(x, from = NA, to = NA, bw = NA, adaptive = TRUE, log = FALSE, ...)
```

Arguments

x	a vector of numbers
from	minimum age of the time axis. If NULL, this is set automatically
to	maximum age of the time axis. If NULL, this is set automatically
bw	the bandwidth of the KDE. If NULL, bw will be calculated automatically using <code>botev()</code>
adaptive	boolean flag controlling if the adaptive KDE modifier of Abramson (1982) is used
log	transform the ages to a log scale if TRUE
...	optional arguments to be passed on to density

Value

an object of class KDE, i.e. a list containing the following items:

x: horizontal plot coordinates

y: vertical plot coordinates

bw: the base bandwidth of the density estimate

ages: the data values from the input to the KDE function

See Also

KDEs

Examples

```
data(Namib)
samp <- Namib$DZ$x[['N1']]
dens <- KDE(samp,0,3000,kernel="epanechnikov")
plot(dens)
```

KDEs

*Generate an object of class KDEs***Description**

Convert a dataset of class `distributional` into an object of class `KDEs` for further processing by the `summaryplot` function.

Usage

```
KDEs(x, from = NA, to = NA, bw = NA, samebandwidth = TRUE,
      adaptive = TRUE, pch = NA, normalise = FALSE, log = FALSE, ...)
```

Arguments

<code>x</code>	an object of class <code>distributional</code>
<code>from</code>	minimum limit of the x-axis.
<code>to</code>	maximum limit of the x-axis.
<code>bw</code>	the bandwidth of the kernel density estimates. If <code>bw = NA</code> , the bandwidth will be set automatically using <code>botev()</code>
<code>samebandwidth</code>	boolean flag indicating whether the same bandwidth should be used for all samples. If <code>samebandwidth = TRUE</code> and <code>bw = NULL</code> , then the function will use the median bandwidth of all the samples.
<code>adaptive</code>	boolean flag switching on the adaptive bandwidth modifier of Abramson (1982)
<code>pch</code>	(optional) symbol to be used to mark the sample points along the x-axis
<code>normalise</code>	boolean flag indicating whether or not the KDEs should all integrate to the same value.
<code>log</code>	boolean flag indicating whether the data should be plotted on a logarithmic scale.
<code>...</code>	optional parameters to be passed on to <code>density</code>

Value

an object of class KDEs, i.e. a list containing the following items:

kdes: a named list with objects of class KDE

from: the beginning of the common time scale

to: the end of the common time scale

themax: the maximum probability density of all the KDEs

pch: the plot symbol to be used by plot.KDEs

xlabel: the x-axis label to be used by plot.KDEs

See Also

KDE

Examples

```
data(Namib)
KDEs <- KDEs(Namib$DZ, 0, 3000, pch=NA)
summaryplot(KDEs, ncol=3)
```

KS.diss

Kolmogorov-Smirnov dissimilarity

Description

Returns the Kolmogorov-Smirnov dissimilarity between two samples

Usage

```
KS.diss(x, y)
```

Arguments

x the first sample as a vector

y the second sample as a vector

Value

a scalar value representing the maximum vertical distance between the two cumulative distributions

Examples

```
data(Namib)
print(KS.diss(Namib$DZ$x[['N1']], Namib$DZ$x[['T8']]))
```

Description

Performs classical or nonmetric Multidimensional Scaling analysis

Multidimensional Scaling of compositional data

Multidimensional Scaling of distributional data

Multidimensional Scaling of a dissimilarity matrix

Usage

```
MDS(x, ...)
```

```
## S3 method for class 'compositional'
```

```
MDS(x, classical = FALSE, ...)
```

```
## S3 method for class 'distributional'
```

```
MDS(x, classical = FALSE, ...)
```

```
## S3 method for class 'diss'
```

```
MDS(x, classical = FALSE, ...)
```

Arguments

<code>x</code>	an object of class <code>distributional</code> , <code>compositional</code> or <code>diss</code>
<code>...</code>	optional arguments to be passed onto <code>diss</code> (if <code>x</code> is of class <code>compositional</code> or <code>distributional</code>) or onto <code>cmdscale</code> or <code>isoMDS</code> (if <code>x</code> is of class <code>dist</code>).
<code>classical</code>	boolean flag indicating whether classical (TRUE) or nonmetric (FALSE) MDS should be used

Value

an object of class `MDS`, i.e. a list containing the following items:

`points`: a two column vector of the fitted configuration

`classical`: a boolean flag indicating whether the MDS configuration was obtained by classical (TRUE) or nonmetric (FALSE) MDS.

`diss`: the dissimilarity matrix used for the MDS analysis

`stress`: (only if `classical=TRUE`) the final stress achieved (in percent)

Examples

```
data(Namib)
plot(MDS(Namib$Major,classical=TRUE))
```

minsorting

*Assess settling equivalence of detrital components***Description**

Models grain size distribution of minerals and rock fragments of different densities

Usage

```
minsorting(X, dens, sname = NULL, phi = 2, sigmaphi = 1,
          medium = "freshwater", from = -2.25, to = 5.5, by = 0.25)
```

Arguments

X	an object of class <code>compositional</code>
dens	a vector of mineral and rock densities
sname	sample name if unspecified, the first sample of the dataset will be used
phi	the mean grain size of the sample in Krumbein's phi units
sigmaphi	the standard deviation of the grain size distribution, in phi units
medium	the transport medium, one of either "air", "freshwater" or "seawater"
from	the minimum grain size to be evaluated, in phi units
to	the maximum grain size to be evaluated, in phi units
by	the grain size interval of the output table, in phi units

Value

an object of class `minsorting`, i.e. a list with two tables:

`mfract`: the grain size distribution of each mineral (sum of the columns = 1)

`mcomp`: the composition of each mineral (sum of the rows = 1)

Author(s)

Alberto Resentini and Pieter Vermeesch

Examples

```
data(endmembers,densities)
distribution <- minsorting(endmembers,densities,sname='ophiolite',phi=2,
                           sigmaphi=1,medium="seawater",by=0.05)
plot(distribution,cumulative=FALSE)
```

Namib

An example dataset

Description

A large dataset of provenance data from Namibia comprised of 14 sand samples from the Namib Sand Sea and 2 samples from the Orange River.

Details

Namib is a list containing the following 6 items:

DZ: a distributional dataset containing the zircon U-Pb ages for ca. 100 grains from each sample, as well as their (1-sigma) analytical uncertainties.

PT: a compositional dataset with the bulk petrography of the samples, i.e. the quartz ('Q'), K-feldspar ('KF'), plagioclase ('P'), and lithic fragments of metamorphic ('Lm'), volcanic ('Lv') and sedimentary ('Ls') origin.

HM: a compositional dataset containing the heavy mineral composition of the samples, comprised of zircon ('zr'), tourmaline ('tm'), rutile ('rt'), Ti-oxides ('TiOx'), titanite ('sph'), apatite ('ap'), epidote ('ep'), garnet ('gt'), staurolite ('st'), andalusite ('and'), kyanite ('ky'), sillimanite ('sil'), amphibole ('amp'), clinopyroxene ('cpx') and orthopyroxene ('opx').

PTHM: a compositional dataset combining the variables contained in PT and HM plus 'mica', 'opaques', 'turbids' and 'other' transparent heavy minerals ('LgM'), normalised to 100.

Major: a compositional dataset listing the concentrations (in wt TiO₂, P₂O₅ and MnO).

Trace: a compositional data listing the concentrations (in ppm) of Rb, Sr, Ba, Sc, Y, La, Ce, Pr, Nd, Sm, Gd, Dy, Er, Yb, Th, U, Zr, Hf, V, Nb, Cr, Co, Ni, Cu, Zn, Ga and Pb.

Vermeesch, P. and Garzanti, E., Making geological sense of 'Big Data' in sedimentary provenance analysis, *Chemical Geology* 409 (2015) 20-27

Examples

```
data(Namib)
samp <- Namib$DZ$x[['N1']]
dens <- KDE(samp,0,3000)
plot(dens)
```

PCA

*Principal Component Analysis***Description**

Performs PCA of compositional data using a centred logratio distance

Usage

```
PCA(x, ...)
```

Arguments

`x` an object of class `compositional`
`...` optional arguments to R's `princomp` function

Value

an object of classes `PCA`, which is synonymous to the stats packages' `princomp` class.

Examples

```
data(Namib)
plot(MDS(Namib$Major, classical=TRUE))
dev.new()
plot(PCA(Namib$Major), asp=1)
print("This example demonstrates the equivalence of classical MDS and PCA")
```

plot.compositional

*Plot a pie chart***Description**

Plots an object of class `compositional` as a pie chart

Usage

```
## S3 method for class 'compositional'
plot(x, sname, annotate = TRUE, colmap = NULL, ...)
```

Arguments

x	an object of class compositional
sname	the sample name
annotate	a boolean flag controlling if the pies of the pie-chart should be labeled
colmap	an optional string with the name of one of R's built-in colour palettes (e.g., heat.colors, terrain.colors, topo.colors, cm.colors), which are to be used for plotting the data.
...	optional parameters to be passed on to the graphics object

Examples

```
data(Namib)
plot(Namib$HM, 'N1', colmap='heat.colors')
```

plot.distributional *Plot continuous data as histograms or cumulative age distributions*

Description

Plot one or several samples from a distributional dataset as a histogram or Cumulative Age Distributions (CAD).

Usage

```
## S3 method for class 'distributional'
plot(x, snames = NULL, annotate = TRUE,
      CAD = FALSE, pch = NA, verticals = TRUE, colmap = NULL, ...)
```

Arguments

x	an object of class distributional
snames	a string or a vector of string with the names of the samples that need plotting if snames is a vector, then the function will default to a CAD.
annotate	boolean flag indicating whether the x- and y-axis should be labeled
CAD	boolean flag indicating whether the data should be plotted as a cumulative age distribution or a histogram. For multi-sample plots, the function will override this value with TRUE.
pch	an optional the symbol to mark the sample points along the CAD
verticals	boolean flag indicating if the horizontal lines of the CAD should be connected by vertical lines
colmap	an optional string with the name of one of R's built-in colour palettes (e.g., heat.colors, terrain.colors, topo.colors, cm.colors), which are to be used for plotting the data.
...	optional arguments to the generic plot function

Examples

```
data(Namib)
plot(Namib$DZ,c('N1','N2'))
```

plot.GPA

Plot a Procrustes configuration

Description

Plots the group configuration of a Generalised Procrustes Analysis

Usage

```
## S3 method for class 'GPA'
plot(x, ...)
```

Arguments

x an object of class GPA
 ... optional arguments to the generic plot function

See Also

procrustes

Examples

```
data(Namib)
GPA <- procrustes(Namib$DZ,Namib$HM)
plot(GPA)
```

plot.INDSCAL

Plot an INDSCAL group configuration and source weights

Description

Given an object of class INDSCAL, generates two plots: the group configuration and the subject weights. Together, these describe a 3-way MDS model.

Usage

```
## S3 method for class 'INDSCAL'
plot(x, asp = 1, xlab = "X", ylab = "Y", xaxt = "n",
     yaxt = "n", ...)
```

Arguments

x	an object of class INDSCAL
asp	the aspect ratio of the plot
xlab	a string with the label of the x axis
ylab	a string with the label of the y axis
xaxt	if = 'y', adds ticks to the x axis
yaxt	if = 'y', adds ticks to the y axis
...	optional arguments to the generic plot function

See Also

indscal

Examples

```
data(Namib)
plot(indscal(Namib$DZ,Namib$HM))
```

plot.KDE	<i>Plot a kernel density estimate</i>
----------	---------------------------------------

Description

Plots an object of class KDE

Usage

```
## S3 method for class 'KDE'
plot(x, pch = "|", xlab = "age [Ma]", ylab = "", ...)
```

Arguments

x	an object of class KDE
pch	the symbol used to show the samples. Set pch = NA to turn them off
xlab	the label of the x-axis
ylab	the label of the y-axis
...	optional parameters to be passed on to the graphics object

See Also

KDE

Examples

```
data(Namib)
samp <- Namib$DZ$x[['N1']]
dens <- KDE(samp,0,3000)
plot(dens)
```

plot.MDS

Plot an MDS configuration

Description

Plots the coordinates of a multidimensional scaling analysis as an X-Y scatter plot or 'map' and, if `x$classical = FALSE`, a Shepard plot.

Usage

```
## S3 method for class 'MDS'
plot(x, nnlines = FALSE, xlab = "", ylab = "", xaxt = "n",
     yaxt = "n", ...)
```

Arguments

<code>x</code>	an object of class MDS
<code>nnlines</code>	if TRUE, draws nearest neighbour lines
<code>xlab</code>	a string with the label of the x axis
<code>ylab</code>	a string with the label of the y axis
<code>xaxt</code>	if = 's', adds ticks to the x axis
<code>yaxt</code>	if = 's', adds ticks to the y axis
<code>...</code>	optional arguments to the generic plot function

See Also

MDS

plot.minsorting	<i>Plot inferred grain size distributions</i>
-----------------	---

Description

Plot the grain size distributions of the different minerals under consideration

Usage

```
## S3 method for class 'minsoring'
plot(x, cumulative = FALSE, components = NULL, ...)
```

Arguments

x	an object of class minsoring
cumulative	boolean flag indicating whether the grain size distribution should be plotted as a density or cumulative probability curve.
components	string or list of strings with the names of a subcomposition that needs plotting
...	optional parameters (see ?par for details)

See Also

minsoring

Examples

```
data(endmembers,densities)
OPH <- subset(endmembers,select="ophiolite")
distribution <- minsoring(OPH,densities,phi=2,sigmaphi=1,medium="air",by=0.05)
plot(distribution,components=c('F','px','opaques'))
```

plot.PCA	<i>Compositional biplot</i>
----------	-----------------------------

Description

Plot the results of a principal components analysis as a biplot

Usage

```
## S3 method for class 'PCA'
plot(x, ...)
```

Arguments

x an object of class PCA
 ... optional arguments of the biplot function

See Also

PCA

Examples

```
data(Namib)
plot(PCA(Namib$Major))
```

plot.ternary	<i>Plot a ternary diagram</i>
--------------	-------------------------------

Description

Plots triplets of compositional data on a ternary diagram

Usage

```
## S3 method for class 'ternary'
plot(x, type = "empty", pch = NA, labels = names(x),
      showpath = FALSE, col = "cornflowerblue", ...)
```

Arguments

x an object of class ternary
 type adds annotations to the ternary diagram, one of either empty, QFL.descriptive, QFL.folk or QFL.dickinson
 pch plot character, see ?par for details
 labels vector of strings to be added to the plot symbols
 showpath if x has class SRDcorrected, and showpath==TRUE, the intermediate values of the SRD correction will be plotted on the ternary diagram as well as the final composition
 col colour to be used for the background lines (if applicable)
 ... optional arguments to the generic points function

See Also

ternary

Examples

```
data(Namib)
tern <- ternary(Namib$PT, 'Q', c('KF', 'P'), c('Lm', 'Lv', 'Ls'))
plot(tern, type='QFL.descriptive')
```

`procrustes`*Generalised Procrustes Analysis of provenance data*

Description

Given a number of input datasets, this function performs an MDS analysis on each of these and the feeds the resulting configurations into the `GPA()` function.

Usage

```
procrustes(...)
```

Arguments

... a sequence of datasets of classes distributional and compositional

Value

an object of class GPA, i.e. a list containing the following items:

points: a two column vector with the coordinates of the group configuration

labels: a list with the sample names

Author(s)

Pieter Vermeesch

References

Gower, J.C. (1975). Generalized Procrustes analysis, *Psychometrika*, 40, 33-50.

GPA

Examples

```
data(Namib)
gpa <- procrustes(Namib$DZ, Namib$HM)
plot(gpa)
```

provenance	<i>Menu-based interface for provenance</i>
------------	--

Description

For those less familiar with the syntax of the R programming language, the `provenance()` function provides a user-friendly way to access the most important functionality in the form of a menu-based query interface. Further details and examples are provided on <http://provenance.london-geochron.com>

Usage

```
provenance()
```

Author(s)

Pieter Vermeesch

References

Vermeesch, P., Resentini, A. and Garzanti, E., an R package for statistical provenance analysis, *Sedimentary Geology*, doi:10.1016/j.sedgeo.2016.01.009.

read.compositional	<i>Read a .csv file with categorical data</i>
--------------------	---

Description

Reads a data table containing categorical data (e.g. petrographic, heavy mineral or geochemical data)

Usage

```
read.compositional(fname, method = NULL, colmap = "rainbow")
```

Arguments

fname	a string with the path to the .csv file
method	either "bray" (for the Bray-Curtis distance) or "aitchison" (for Aitchison's central logratio distance). If omitted, the function defaults to 'aitchison', unless there are zeros present in the data.
colmap	an optional string with the name of one of R's built-in colour palettes (e.g., heat.colors, terrain.colors, topo.colors, cm.colors), which are to be used for plotting the data.

Value

an object of class `compositional`, i.e. a list with the following items:

`x`: a data frame with the samples as rows and the categories as columns

`method`: either "aitchison" (for Aitchison's centred logratio distance) or "bray" (for the Bray-Curtis distance)

Examples

```
fname <- system.file("Major.csv", package="provenance")
Major <- read.compositional(fname)
plot(PCA(Major))
```

<code>read.densities</code>	<i>Read a .csv file with mineral and rock densities</i>
-----------------------------	---

Description

Reads a data table containing densities to be used for hydraulic sorting corrections (`minsorting` and `srd` functions)

Usage

```
read.densities(fname)
```

Arguments

`fname` a string with the path to the .csv file

Value

a vector with mineral and rock densities

Examples

```
data(Namib, densities)
N8 <- subset(Namib$HM, select="N8")
distribution <- minsorting(N8, densities, phi=2, sigmaphi=1, medium="air", by=0.05)
plot(distribution)
```

`read.distributional` *Read a .csv file with continuous (detrital zircon) data*

Description

Reads a data table containing continuous data (e.g. detrital zircon ages)

Usage

```
read.distributional(fname, errorfile = NA, method = "KS",
  xlab = "age [Ma]", colmap = "rainbow")
```

Arguments

<code>fname</code>	the path of a .csv file with the input data, arranged in columns.
<code>errorfile</code>	the (optional) path of a .csv file with the standard errors of the input data, arranged by column in the same order as <code>fname</code> . Must be specified if the data are to be compared with the Sircombe-Hazelton dissimilarity.
<code>method</code>	an optional string specifying the dissimilarity measure which should be used for comparing this with other datasets. Should be one of either "KS" (for Kolmogorov-Smirnov) or "SH" (for Sircombe and Hazelton). If <code>method = "SH"</code> , then <code>errorfile</code> should be specified. If <code>method = "SH"</code> and <code>errorfile</code> is unspecified, then the program will default back to the Kolmogorov-Smirnov dissimilarity.
<code>xlab</code>	an optional string specifying the nature and units of the data. This string is used to label kernel density estimates.
<code>colmap</code>	an optional string with the name of one of R's built-in colour palettes (e.g., <code>heat.colors</code> , <code>terrain.colors</code> , <code>topo.colors</code> , <code>cm.colors</code>), which are to be used for plotting the data.

Value

an object of class `distributional`, i.e. a list with the following items:

- `x`: a named list of vectors containing the numerical data for each sample
- `err`: an (optional) named list of vectors containing the standard errors of `x`
- `method`: either "KS" (for Kolmogorov-Smirnov) or "SH" (for Sircombe Hazelton)
- `breaks`: a vector with the locations of the histogram bin edges
- `xlab`: a string containing the label to be given to the x-axis on all plots

Examples

```
agefile <- system.file("DZ.csv", package="provenance")
errfile <- system.file("DZerr.csv", package="provenance")
DZ <- read.distributional(agefile, errfile)
plot(KDE(DZ$x$N1))
```

restore	<i>Undo the effect of hydraulic sorting</i>
---------	---

Description

Restore the detrital composition back to a specified source rock density (SRD)

Usage

```
restore(X, dens, target = 2.71)
```

Arguments

X	an object of class <code>compositional</code>
dens	a vector of rock and mineral densities
target	the target density (in g/cm ³)

Value

an object of class `SRDcorrected`, i.e. an object of class `compositional` which is a daughter of class `compositional` containing the restored composition, plus one additional member called `restoration`, containing the intermediate steps of the SRD correction algorithm.

Author(s)

Alberto Resentini and Pieter Vermeesch

`minsorting`

Examples

```
data(Namib,densities)
rescomp <- restore(Namib$PTHM,densities,2.71)
HMcomp <- c("zr","tm","rt","sph","ap","ep","gt",
            "st","amp","cpx","opx")
amcomp <- amalgamate(rescomp,Plag="P",HM=HMcomp,Opq="opaques")
plot(ternary(amcomp),showpath=TRUE)
```

SH.diss

*Sircombe and Hazelton distance***Description**

Calculates Sircombe and Hazelton's L2 distance between the Kernel Functional Estimates (KFEs, not to be confused with Kernel Density Estimates!) of two samples with specified analytical uncertainties

Usage

```
SH.diss(x, i, j, c.con = 0)
```

Arguments

x	an object of class <code>distributional</code>
i	index of the first sample
j	index of the second sample
c.con	smoothing bandwidth of the kernel functional estimate

Value

a scalar value expressing the L2 distance between the KFEs of samples i and j

Author(s)

Keith Sircombe and Martin Hazelton

References

KS.diss

Examples

```
datfile <- system.file("DZ.csv", package="provenance")
errfile <- system.file("DZerr.csv", package="provenance")
DZ <- read.distributional(datfile, errfile)
d <- SH.diss(DZ, 1, 2)
print(d)
```

`subset.compositional` *Get a subset of compositional data*

Description

Return a subset of provenance data according to some specified indices

Usage

```
## S3 method for class 'compositional'  
subset(x, subset = NULL, select = NULL,  
       components = NULL, ...)
```

Arguments

<code>x</code>	an object of class <code>compositional</code>
<code>subset</code>	logical expression indicating elements or rows to keep: missing values are taken as false.
<code>select</code>	a vector of sample names.
<code>components</code>	a vector specifying a subcomposition
<code>...</code>	optional arguments for the generic subset function

Value

an object of class `compositional`

See Also

`read.compositional`

`subset.distributional` *Get a subset of distributional data*

Description

Return a subset of provenance data according to some specified indices

Usage

```
## S3 method for class 'distributional'  
subset(x, subset = NULL, select = NULL, ...)
```

Arguments

<code>x</code>	an object of class <code>distributional</code>
<code>subset</code>	logical expression indicating elements or rows to keep: missing values are taken as false.
<code>select</code>	a vector of sample names
<code>...</code>	optional arguments for the generic subset function

Value

an object of class `distributional`

See Also

`read.distributional`

Examples

```
data(Namib)
coast <- subset(Namib$HM,select=c("N1","N2","T8","T13","N12","N13"))
summaryplot(coast,ncol=2)
```

summaryplot

Joint plot of several provenance datasets

Description

Arranges kernel density estimates and pie charts in a grid format

Usage

```
summaryplot(..., ncol = 1)
```

Arguments

<code>...</code>	a sequence of datasets of class <code>compositional</code> , <code>KDEs</code> , or <code>distributional</code>
<code>ncol</code>	the number of columns

Value

a summary plot of all the data comprised of KDEs for the datasets of class `KDEs`, pie charts for those of class `compositional` and histograms for those of class `distributional`.

See Also

`KDEs`

Examples

```
data(Namib)
KDEs <- KDEs(Namib$DZ,0,3000)
summaryplot(KDEs,Namib$HM,Namib$PT,ncol=2)
```

ternary

Define a ternary composition

Description

Create an object of class ternary

Usage

```
ternary(X, x = NULL, y = NULL, z = NULL)
```

Arguments

X	an object of class compositional
x	string or a vector of strings indicating the variables making up the first sub-composition of the ternary system. If omitted, the first component of X is used instead.
y	second (set of) variables
z	third (set of) variables

Value

an object of class ternary, i.e. a list containing:

x: a three column matrix (or vector) of ternary compositions.

and (if X is of class SRDcorrected)

restoration: a list of intermediate ternary compositions inherited from the SRD correction

See Also

restore

Examples

```
data(Namib)
tern <- ternary(Namib$PT,c('Q'),c('KF','P'),c('Lm','Lv','Ls'))
plot(tern,type="QFL")
```
